

Figure 1: Location of K4 South with respect to other prospects at the southern end of the Reo Project.

K4 South (circled red) is located within an extensive region of auger defined saprolite gold anomalism.

Shown is the +12ppb contour enclosing ~ 13 million square metres, within which many better auger results have been obtained.

Other prospects will be detailed in subsequent announcements.

Permit boundaries shown blue.

Insets show location of Reo project within Burkina Faso ~ 120km west of the Capital Ougadadougou and location of the southern prospects (outlined red) against regional auger saprolite gold geochemistry with red being >14ppb
