

Figure 10: Interpreted Auger agrees broadly with the interpretation based on artisanal workings.

Here the contour of >80ppb auger values as interpreted by following magnetic contacts discernible in measured horizontal gradient airborne survey data is shown (hatched light grey). This contour is substantively the same as the >100ppb contour except for some minor adjustments.

A slightly different but thematically similar interpretation of the axial traces is presented here (dashed lines). With F3 being shown as straight lines.
